

NATURAL WAYS TO OVERCOME ADHD AND ADD

For decades, Ritalin and similar stimulants have reigned over other treatments for ADHD and ADD. The meds are seemingly tried and true, with numerous studies backing their effectiveness. However, the latest results from the Multimodal Treatment Study of Children with ADHD, the largest investigation of the benefits of medication against behavioral therapy found that stimulants effects wane over time. In addition, the study found that more than 0 percent of the children on stimulants stopped taking the medication within eight years. What's more, the medications used in the study might have stunted participants growth, researchers concluded.

The vast majority of kids respond positively to one or more of the approved medications for ADHD, according to Mina Dulcan, head of child and adolescent psychiatry at Children's Memorial Hospital in Chicago. But it's not as simple as finding an ADHD drug that works. Many of these children, she observes, have problems besides ADHD that may also need to be addressed.

Experts have a lengthy list of techniques other than prescriptions drugs that may help manage ADHD symptom. Here is a quick look at some of them.

EXERCISE: There is increasing evidence that physical activity is good for the brain as well as the heart, said Eugene Arnold, professor emeritus of psychiatry at Ohio State University. U.S. News has reported on research that linked aerobic exercise to kids achievement in math and reading. Arnold's team is working on a pilot study to find out whether exercises that train the cerebellum, such as running in place or navigating around cones, are more beneficial for children with reading problems and ADHD than an exercise program that involves aerobics. Superparenting for ADD puts exercise No. 2 on his list of so-called alternative treatments for ADHD, behind creating a positive, loving environment at home and above getting enough sleep.

Positive Parenting: Authors of a review published last year in *Clinical Pediatrics* wrote the parents of kids with ADHD are often more controlling and disapproving of their children are more likely to reprimand, and are less supportive than parents of kids without the disorder. Training programs can teach parents how to reward good behavior by, for example, awarding points or privileges to kids for focusing on their homework. Considerable scientific evidence indicates that receiving training in key parenting skills helps parents manage their kids behavioral problems, although studies showing the long-term benefits of the treatment are lacking. Absolutely essential to any treatment program for ADD should be positive relationships, "both at home and at school."
